

Executive Summary

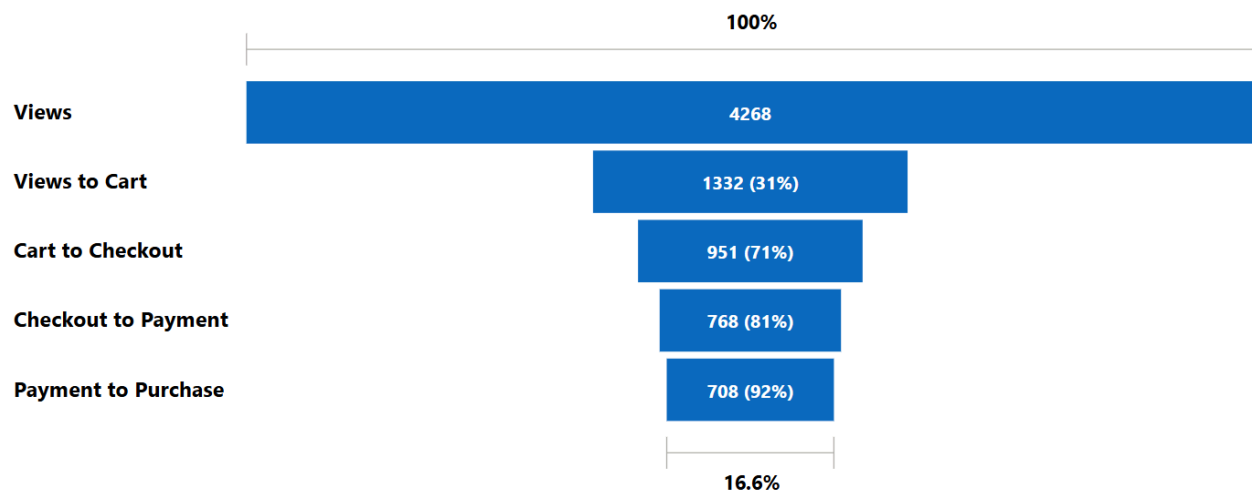

- Overall funnel conversion rate was 16.6%
 - Checkout stages performed efficiently with 80%+ conversion rates
 - The largest drop off occurred between product views and cart additions
 - Email marketing generated the highest conversion rate (34%)
 - Social media delivered high traffic volume but weak purchasing
-

Marketing Funnel Analysis

Checkout-to-Purchase Conversion Performs Strongly

The conversion rate from checkout to purchase (~80%+), with customers spending ~4 minutes at each stage of the checkout process. This indicates that the checkout experience is smooth and frictionless.

Since users who reach the checkout stage are successfully completing purchases, **redesigns or modifications to the checkout flow are currently unnecessary. Maintaining the existing experience while monitoring performance should be the priority.**

Low View-to-Cart Conversion Indicates Purchase Friction

The conversion rate from product (views to cart) is relatively low at 31%. This suggests that a large portion of **visitors browse products** but do not show strong purchase intent or fail to proceed further in the funnel.

Possible contributing factors may include:

- Friction in the add-to-cart experience
- Lack of trust signals
- Poor call-to-action placement
- Weak product descriptions or visuals
- Product pricing

Further investigation through A/B testing, heatmaps, or user behavior analysis could help identify the primary cause of drop-offs at this stage.

Traffic Source Analysis

Social Media Generates High Traffic but Low Conversion

Social media contributes **~30% of total website traffic**. However, it recorded the lowest conversion rate at only **7%**.

This indicates that while social campaigns are successful at attracting visitors, the traffic quality is relatively weak and may not consist of high-intent buyers. As a result, marketing spend on social media may be generating visibility rather than actual revenue.

To improve performance:

- Focus more on retargeting campaigns
- Improve audience targeting
- Prioritize lead generation over broad awareness campaigns
- Optimize landing pages

Email Marketing Delivers the Highest Conversion Rate

Email traffic demonstrates the strongest performance among all traffic sources, with a conversion rate of **34%**. This means that 34 out of every 100 visitors acquired through email complete a purchase.

The high conversion rate suggests that email audiences are more engaged and purchase ready compared to other acquisition channels.

Increasing investment in email marketing campaigns could help drive higher revenue by scaling a channel that already performs efficiently.

Revenue Analysis

Average Order Value Supports CAC Benchmarking

The average order value (AOV) is **~\$115**. This provides a benchmark for evaluating customer acquisition costs (CAC) across marketing channels.

Traffic_source	Total_visitor	Total_revenue	Total_customer	Revenue_per_visitor	Avg_order_value
email	445	15.2K	151	34.1	100.6
organic	1750	32.7K	300	18.7	109.0
paid_ads	820	18.4K	173	22.5	106.6
social	1253	9.7K	84	7.7	115.5
Total	4268	76.0K	708	20.8	107.9

To maintain profitability, acquisition costs should remain within a sustainable range relative to order value. Social media campaigns should be monitored carefully, particularly if CAC exceeds ~ \$30–40 while maintaining low conversion rates.

High acquisition costs combined with poor conversion performance may result in unprofitable transactions and reduced overall marketing efficiency.
